

PIXELRIFT

Online Gaming Website Product Requirements Document

	Website Type Online Gaming Website	Main Build Local frontend platform	Review Goal Complete demo flow
--	---------------------------------------	---------------------------------------	-----------------------------------

1. Product Overview

PixelRift is a browser based gaming website that should feel like a complete but simple gaming platform. The website lets a user browse games, read details, play one simple browser game, join sample tournaments, check rankings, manage a profile, contact support, and test admin content tools. It is not only a landing page. It is a connected product experience that a reviewer can open and use from start to finish.

The tone of the product should be friendly and clear. A young user should understand where to click, what each page does, and what happened after each action. A reviewer should also see that the design, data, states, and page flow were planned carefully.

2. Project Purpose

The purpose of PixelRift is to show the main workflow of an online gaming platform without using a complex server. The website should answer simple questions: What games are available, how does each game work, can I play something now, can I join a tournament, where do I rank, and how can sample content be managed.

3. Product Workflow

Step	Screen	Expected Result
1	Home	User sees the brand, feature highlights, tournament preview, top players, and action buttons.
2	Games	User browses at least 12 original sample games and opens a details page.
3	Details	User reads the game description, rating, difficulty, players count, how to play, and related games.
4	Play	User starts one working browser game with score, control buttons, and timer or progress.
5	Tournaments	User joins when logged in or sees a clear login message when logged out.
6	Profile and Admin	User edits profile or tests admin add, edit, and delete actions for sample content.

4. Core Website Scope

Area	Scope
Home Page	Create the main entry page with logo or text logo, navigation, hero, short intro, action buttons, featured games, tournament preview, top players, why join section, and footer.
Login and Register	Create forms for new and returning users. Register must collect name, email, username, password, and confirm password. Login must accept email or username and password. Show helpful errors and success messages.
Games Listing	Show at least 12 sample games with image, name, category, short description, rating, Play button, and View Details button. Use original names and clean cards.
Game Details	Each game needs a details page with title, image or banner, category, description, rating, difficulty level, number of players, how to play, Play Now button, and related games.
Game Play	Build one real browser game. It can be a click target, reaction timer, memory card, or simple puzzle game. It must not be only an image. It needs start, pause, score, timer or progress, and back button.
Tournaments	Show at least 5 sample tournaments with name, game, date, time, player count, status, and Join button. Joined state should appear when possible.
Leaderboard	Show at least 15 sample players with rank, username, game, score, wins, and points. Top 3 players should stand out. Sorting or filtering should help users compare rankings.

Area	Scope
Profile and Contact	Profile shows user details, game totals, joined tournaments, favorite games, and edit option. Contact page validates name, email, subject, and message, then shows success.
Admin Dashboard	Admin view shows total users, games, and tournaments. It also supports add, edit, and delete actions for games and tournaments using local data or frontend state.

5. Design Direction

Design Item	Requirement
Visual Style	Use a modern gaming look with dark background, neon blue and purple accents, white or light gray text, bold headings, strong contrast, and clean spacing.
Page Feel	Every page should feel connected to the same PixelRift brand. The product must not look empty, plain, old, copied, or unfinished.
Cards and Buttons	Use card based layouts for games, tournaments, rankings, and admin lists. Buttons should be clear and easy to tap.
Feedback	Use simple messages, badges, and state changes so users know when something worked or failed.
Mobile	Mobile layout must stack cards neatly, keep text readable, resize images, and make tables readable or scrollable.

6. Assets Required

Asset	Use
PixelRift Logo	A simple text logo or small logo mark that works on a dark background.
Hero Visual	A safe gaming themed hero image or designed background for the home page.
Game Images	Safe placeholder, royalty free, or AI generated images for game cards and detail pages.
Icons	Small icons for navigation, games, tournaments, leaderboard, profile, contact, admin, and actions.
Style Assets	Reusable colors, spacing, button styles, card styles, form styles, and table styles.
Asset Safety	Do not use copyrighted game posters, real company game art, copied brand images, or real game assets.

7. Data and State Plan

Use local sample data only. The project must include at least 12 games, 5 tournaments, 15 leaderboard players, and 3 sample users. Names should be realistic but original. Data can live in JavaScript files, JSON files, frontend state, or local storage. The important point is that the reviewer can see a believable product flow without needing a real database.

State Area	Expected Behavior
Login State	Navigation should change between Login and Logout. Protected actions should show the correct message.
Tournament State	Join action should show success for logged in users and a login required message for logged out users.
Profile State	Username and profile image link can update through local storage or frontend state.
Admin State	Add, edit, and delete actions should update sample games or tournaments during the session.
UI States	Show loading, empty, active, joined, success, error, locked, logged in, and logged out states where useful.

8. Technical Rules

Rule	Requirement
Allowed Stack	HTML, CSS, JavaScript, React, Next.js, Vue, Svelte, Tailwind CSS, or normal CSS may be used.
Local Run	The website must run locally with clear setup instructions. External service dependency is not required.
Structure	Use a clean folder structure. A component based structure is preferred, but simple HTML, CSS, and JavaScript is acceptable if complete.
README	README should include project name, short description, features, pages included, technology used, install steps, run steps, admin details if needed, and important notes.
Restrictions	Do not include gambling, betting, casino features, real money games, adult content, real payment gateway, real multiplayer server, copied design, broken buttons, empty pages, or fake pages.

9. Suggested Folder Structure

```
pixelrift-gaming/  
  public/  
    images/  
    icons/  
  src/  
    components/  
    pages/  
    data/  
    styles/  
    utils/  
  README.md  
  package.json
```

Simple structure is also acceptable: index.html, styles.css, script.js, data.js, README.md

10. Testing Plan

Test	Pass Result
Startup	Website opens locally without error and README steps are clear.
Navigation	Home, Games, Tournaments, Leaderboard, Profile, Contact, and Login or Logout all work.
Forms	Register, login, profile edit, and contact form show correct success and error messages.
Content Counts	Games list has 12 games, tournaments page has 5 tournaments, and leaderboard has 15 players.
Game Play	One browser game works with start, pause, score, and timer or progress.
Admin	Admin dashboard can add, edit, and delete sample games or tournaments.
Responsive	Desktop, laptop, tablet, and mobile layouts are readable and usable.

11. Deliverables

Submit complete source code, all website pages, reusable components, local sample data, safe images or image links, styles or design files, README file, setup instructions, and a working local website. The reviewer should not need extra services to understand the product flow.

12. Acceptance Criteria

Check	Pass Condition
Complete Scope	All 9 website areas are built, connected, and useful.
Working Actions	Login, register, playable game, tournament join, profile edit, contact form, and admin actions work.
Required Data	Project includes 12 games, 5 tournaments, 15 leaderboard players, and 3 sample users.
Quality	Design is consistent, responsive, readable, and not empty or broken.

Check	Pass Condition
Safe Content	No restricted content, copied content, real game assets, or unnecessary external service dependency is included.

13. Final Success Definition

PixelRift is successful when a reviewer can open the project, understand the website quickly, explore games, play one simple game, join tournaments, check rankings, manage a profile, contact support, and manage sample content from the admin dashboard. The final website should feel complete, professional, friendly, and easy to understand.

14. Reviewer Demo Path

Demo Step	Reviewer Action
Start	Open the home page and confirm the brand, hero, key actions, featured games, tournaments, and top players are visible.
Explore	Open Games, scan the cards, use search or filter if available, then open a game details page.
Play	Select Play Now and confirm the browser game starts, pauses, updates score, and shows timer or progress.
Join	Try joining a tournament as logged out, then logged in, and confirm the correct message or joined state appears.
Manage	Update profile information, send the contact form, and test admin add, edit, and delete actions.
Finish	Check mobile layout, table readability, image safety, and README setup steps before final submission.

15. Common Mistakes To Avoid

Risk	Avoidance Rule
Empty Pages	Do not create pages that only show a title or placeholder text.
Fake Buttons	Buttons should either perform the action or show a clear state message.
Copied Assets	Do not use real game posters, brand artwork, or company game names.
Weak Mobile View	Do not leave cards, tables, forms, or navigation broken on small screens.
Missing README	Do not submit without clear setup and run steps.
Unclear States	Do not hide errors, success messages, locked states, or logged out messages.

16. Final Handoff Checklist

Item	Done When
Code	All source files are included and the project opens without missing file errors.
Content	Every required page has useful text, visible sample data, and working navigation.
Assets	Logo, images, icons, and style files are safe, organized, and match the PixelRift theme.
Local Run	Setup steps are written clearly so the reviewer can run the website on their machine.
Final Review	Desktop and mobile views are checked before the folder is submitted.

Keep the final handoff clean, readable, and easy to review. The product should show the complete PixelRift flow without needing hidden steps or outside explanation.
